## DETAILED ACTION

### *Priority*

Applicant should amend the beginning of the specification to include the patent number of the parent application.

### *Double Patenting*

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-10 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1, 8, 10, 25, 28, 29, 49-54 of U.S. Patent No. 6,699,504 (US'504). Although the conflicting claims are not identical, they are not patentably distinct from each other because US'504 discloses a biocompatible therapeutic article comprising a macromer, a biologically active substance, and molecule excluding proteins, wherein the biologically active substance is a protein or polypeptide (see claim 1). The molecule that excludes proteins may be

Art Unit: 1615

polyethylene glycol, or hyaluronic acid or polyvinylpyrrolidone (see claims 28 and 29). The macromer comprises a central core, at least two degradable regions, and at least two polymerizable regions (see claim 8). Central core polymers are listed at claim 10. Degradable region polymers are found at claim 39. The biologically active substance may comprise at least 5% of the dry weight (see claim 25). US'504 differs only in the particular polypeptide disclosed for controlled release. However, those of ordinary skill would have found it well within their skill to select parathyroid-related polypeptide, somatostatin, leutinizing hormone releasing hormone, GLP-1 amylin or GLP-1 amyline analogues, given that the claims are generic to all polypeptides. As such, those of ordinary skill would have expected similar therapeutic results from the use of the polypeptides of claims 6-9 of the instant application given the claims of US'504. The instant claims would have been obvious given the claims of US'504.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-5 are rejected under 35 U.S.C. 102(b) as being anticipated by Hubbell et al.

Hubbell et al disclose polymerized and crosslinked macromers comprising hydrophilic oligomers having biodegradable monomeric or oligomeric extensions, which are terminated on free ends with end cap monomers or oligomers capable of polymerization and crosslinking (see Abstract). The polymerizable regions are separated by at least one degradable regions (see col. 4, lines 40-43). Polyethylene glycol is found in the core region (see col. 5, lines 20-21). Degradable region polymers are listed at col. 8, lines 57-64. two degradable and polymerizable regions may be attached to the core (See col. 4, lines 52-57). The instant claims are anticipated by Hubbell et al.
